17:00–17:20

In this talk we investigate the discretization of an elliptic boundary value problem in 3D by means of the hp-version of the finite element method using a mesh of hexahedrons. The corresponding linear system is solved by a preconditioned conjugate gradient method. The construction of the preconditioner is based on an inexact additive overlapping Schwarz method which was suggested by Pavarino, [1]. The remaining subproblems are treated by a tensor product based preconditioner. This preconditioner uses a basis transformation into a basis which is stable in L_2 and H^1. The construction is based on interpretations of the p-FEM mass and stiffness matrix as weighted h-FEM matrices and a simultaneous diagonalization of these matrices using wavelets.

The preconditioner is implemented into the finite element program `SpCAdHp` for hp-discretizations of scalar elliptic and linear elasticity problems using hexahedral elements with hanging nodes. In the main part of the talk, we illustrate the efficiency of the presented quasioptimal hp-solver on several numerical examples.
