Asymptotic properties of compound distribution tails

Dominik Kortschak* (Univ. Lausanne)*, Hansjörg Albrecher* (Univ. Lausanne)*,*
Christian Hipp (Univ. Karlsruhe)

In this talk we provide some results on higher order asymptotic expansions for the compound sum of subexponential random variables, which subsequently lead to expansions for the ruinprobability in the Cramer-Lundberg risk model. Further we discuss some special cases where a complete asymptotic expansion for the compound sum is available.
